Dear Steltronic Customer,

If you receive an error that says "The referring server address is not 192.168.127.1", the most likely cause is your shortcut that you are double clicking is incorrect. If you right click on this icon, select properties. The "Target" or "start in" section should NOT be:

\\server\tcpserv\consexe\wins.exe us 2

However, it should read something like this:

K:\consexe\wins.exe us 2 (This is the correct shortcut)

When you open "my computer", you must be able to double click on drive K and it should open a folder. If you run into any errors, it may be possible to correct by rebooting the server and this workstation. If this does not work, you may have to "disconnect" this mapped drive and build it again. To map a hard drive, follow these instructions:

Map Network Drive				
Window and ass access Specify that yo	Windows can help you connect to a shared network folder and assign a drive letter to the connection so that you can access the folder using My Computer. Specify the drive letter for the connection and the folder that you want to connect to:			
Drive:	к: 🖌			
Folder:	\\server\tcpserv V Browse			
	Example: \\server\share Image: Reconnect at logon			
	Connect using a <u>different user name</u> ,			
	Sign up for online storage or connect to a network server.			
	< Back Finish Cancel			

- A. Right mouse click on the start button in Windows, then select "Explore All Users"
- B. In the menu, click the tools menu, then select "map network drive"
- C. For the drive letter, select K
- D. For the folder, type this line: \\server\tcpserv
- E. Click the finish button. If Windows opens this new folder, you can close it as this is confirmation you mapped the drive properly. If the folder does not open or you receive an error from Windows, your network connection has been damaged and needs to be corrected.

If you need to make this workstation another number such as #3, follow the instructions below. The Steltronic system cannot and will not allow two separate PC's to run the same ID number of the workstation software.

If you look at the title bar of your other workstations, you will see the number of the workstation.

📲 WINS 6.2.1 - CONSOLE #1	, Current user: Bartender	(F1 = HELP)		
BAR J		▽ 🎇 🛃	🐼 🕎 🎦	se 🕎
	3-4	5-6	7-8	1-8
		CNT	CNT	Billiards
9-10 ??? CNT	11 - 12 ? ? CNT	13-14 ???	15-16 ???	1-4 darts
<u> </u>	- 68 🔬 🦲	18 4 4 a 19	2	

Your server PC will always be #1, and each workstation in the building will have a different number, 2, 3, 4...

(You must have an active drive K for this to work properly)

- A. Click on the start button, then select search.
- B. Search for files or folders.
- C. Search for a file called USWINS and make sure you search the entire local hard drives C

a. When you find all the USWINS shortcuts, right mouse click on each shortcut found and select properties, then in the target window, change the last number to be your workstation number.

- b. If you want this PC to be workstation #2, the target needs to be: k:\consexe\wins.exe US 2
- c. Otherwise, change the very last number to your desired workstation

USWins32 Properties 🛛 🛛 🔀						
General Shortc	General Shortcut Compatibility					
	USWins32					
Target type: Application Target location: CONSEXE						
<u>T</u> arget:	K:\CONSEXE\Wins.exe US 2					
<u>S</u> tart in:						
Shortcut <u>k</u> ey:	None					
<u>B</u> un:	Normal window					
Comment: <u>Find Target</u> <u>Change Icon</u> Advanced						
	OK Cancel Apply					

One more shortcut to change; please do these steps again for another file called Desk Configuration. After your search is complete, change the properties of this file so that your last number in this target is the same number as your workstation number.

Sincerely,

fin Obdals
